

## BrightGreen qPCR MasterMix Selection Guide

Pipetting errors and instrument limitations can become inherently detrimental when viewed in the context of experiments like real-time quantitative PCR or RT-PCR. Therefore, in order to proactively compensate for such inadvertent yet common sources of errors, a reference dye can be very helpful. Inert by nature, a reference dye does not undergo any fluorescence change during experiments like real-time quantitative PCR or RT-PCR. Therefore, the addition of a reference dye helps normalize the fluorescent reporter signal in aforementioned experiments by allowing the software/instrument to adjust for minute differences or well-to-well inconsistencies. In this way, a reference dye enables minimal standard error (with respect to replicates in each experiment) and improves the overall performance of each experiment.

Different companies optimized their instruments with different reference dyes (ROX, Fluorescein, etc). **abm** offers its BrightGreen qPCR MasterMix in a comprehensive array of options where each MasterMix is preconfigured with a reference dye specific for a particular instrument. This way, the customers get to choose what works best for their instrument while having the advantage of using a reference dye.

Please refer and adhere to the guide shown below to select the MasterMix that will best serve your needs.
